I sent my PDF to AI, and here's its feedback:

1. Stop Conditions Not Fully Managed: One key aspect missing in the Trading System is the explicit handling of stop conditions for the trading activity. It's unclear how the system determines when to terminate trading based on user input or specific trading conditions. For instance, the Terminate Trading workflow does not clearly address how ongoing trades are stopped or handled mid-execution.
2. Market Data Comparison for Arbitrage: The comparison of real-time market data to identify arbitrage opportunities is not well detailed. You need to specify how the system keeps track of the latest prices or price spreads for comparison, as this is essential for determining arbitrage opportunities.

For the first one, I added closeAllActiveTrades and it will send the MarketDataSubscriptionTerminated event after it terminates the trade.
For the second one, I found the feedback does not make any senses since we have not yet decided apis that we will use in our project, so I cannot modify the pseudo code for my team member.
