With the suggestion of the GPT, I conducted these tasks

1. I have added error handling to all of the systems to reflect different: kinds of errors that might arise during the workflow, For instance, I added InvalidInput to clarify the possible input error when calculating the data.

2. We have changed several names. I specifically added "historical arbitrage" to most of the steps in the calculation of historical arbitrage workflows to specify

3. I added name of the bounded context before every workflow to reflect the context they are in, especially to clarify the tasks involving multiple workflows across contexts.

In our miro board, we also:

1. Specify each external source as domain service to better reflect how they can assist our core business system.

2. Split up the bounded context in a clearer and organized fashion, like labels for types of bounded context, and how workflows are connected to them.
